

Getting Ready For Us

When we're scheduled to come to your house to install your new garage door we'll need you to make sure a couple of things are done so we can put in your new door.

1. **Access to your garage.** We'll need you to either be home or by pre-arrangement enable us to have access to the garage in your absence (eg. side door left open, key code for your keyless entry).

2. **Clear work area.** We'll need clear floor space in the garage to lay out and assemble your new door. We'll need floor area at least as wide and high as the door. For example, if we're replacing your 16'w x 7'h door, we'd like to have clear floor space of ~18'w and ~10' deep.

Please take your cars out of the garage before we arrive.

3. **Sideroom and headroom clearance.** We'll need some room around the door tracks at the side of the door to remove and / or attach the track brackets - 6"-9" is enough. We'll also need room above the door to remove and / or attach the torsion spring assembly - 12"-24" is enough. **Please remove any shelves that might encroach on these clearances.**

4. Remember that when we're putting in your new door, your garage is a "construction zone". There are potential hazards present. **Please keep young children and pets away from the area when we're working.**
